As an IT professional of the future, I imagine myself to be well-known for creating efficient, user-friendly web applications that solve common problems. Full-stack web development is my passion, where I get to combine design, coding, and database management in an attempt to produce world-class digital goods.

I want to be remembered for clean code, responsiveness, and strong functionality. In the long run, I see myself as a freelance web developer offering bespoke websites, online shops, and content management systems to start-ups and small companies.

My website will be my portfolio and work evidence. It will contain projects that I've undertaken, including front-end interfaces with HTML, CSS, JavaScript, and back-end logic with Node.js and Express. I'll add a contact form, GitHub links, and live demos.

This website will not only display my technical skill but also display my talent for taking concepts and turning them into working applications. In the future, I plan to add development tips and tutorials in the form of blogs in order to help others learn as well as solidify my own skillset. This is my first step at being a known name in web development.
